The rejection of the claims over Loh and Goaker has been withdrawn in response to applicants' arguments. On updating the file another reference was discovered so prosecution of this application continues.

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

Claims 1-44, 47 and 49 are rejected under 35 U.S.C. 103(a) as being unpatentable over Woldhuis (0403030) in view of Mayfield (5,853,778).

Woldhuis discloses a coating for cheese made of wax and a wax-like fat of the composition of the claims (abstract, page 3, lines 5-23 and claims 1-2). The composition was applied to cheese and found to prevent or reduce the movement of water from the product (page 3, lines 24-32). Wax sources applied are shown in the Tables. Both short and long-chained fatty acids are esterified to the glycerol of the molecule in the chain-length specified by the claims. Although branched fatty acids are not mentioned, it would have been obvious to expect branched and straight chain fatty acids to be included in a fatty acid of a chain length of more than 4.

Although the molar ratio of ingredients of claims 17-21 is not mentioned, the ratio would have been expected from the triglyceride description at page 3, lines 15-18. The inclusion of sorbitan esters (claim 39) is suggested in Woldhuis in Table A, line 15. Citric acid esters are mentioned in Table D. It is appreciated that the limited amount of these auxiliary ingredients is not mentioned (claims 41-44) but it is obvious from the different coating mixtures prepared that one of ordinary skill in the art would be able to adjust the amount of auxiliary ingredient according to the particular coating properties desired in the film. It is appreciated that the interesterification method by which the fat is made is not mentioned in the reference, but the claims are directed to the product and not to the method by which it is made. Further one of ordinary skill in the art would have expected a triglyceride containing a lot of short-chain fatty acids would have been made by interesterification because this type of triglyceride is not typically found in nature. The claims appear to differ from Woldhuis in the use of the coated cheese product in a multi-component foodstuff. First cheese is known to be consumed in sandwiches. Mayfield teaches using edible films as moisture barrier for use in sandwiches to separate dry foods from wet or sticky foods (abstract and column 6, lines 7-19). In the

background of the invention various edible coatings are suggested that include wax and short-chain fatty acids without specifically mentioning Woldhuis. It would have been obvious to one of ordinary skill in the art to use the coating of Woldhuis as an edible film in a cheese sandwich in order to preserve the sandwich and prevent the bread in the sandwich from getting soggy. In this case the cheese is the high moisture food.
